an installation equipped with a sensor device having the first layer is shared by the two capacitors and having a shared absorption area, an additional capacitor being formed upon filling of the container with a medium, whose effective capacitance experiences a detectable change corresponding to the fill level, which is tapped at the second layer of the second capacitor, as recited in the independent claim 27;

a facility for recognizing persons having sensor having the first layer is shared by the two capacitors and having a shared absorption area, an additional capacitor being formed upon the approach or contact of a person to the absorption area, whose effective experiences a detectable change that is tapped at the second layer of the second capacitor, as recited in the independent claim 31; and in combination of the claims.
